J Track System
PLEASE NOTE: These instructions are specific to a particular Track System. Adjustments may be needed on your part for changes in specifications and measurements, as well as Track Systems that are different than these.
When installing your Track, be sure you are drilling into wall studs or into a Header that is installed through the wall studs. This will provide the stability your wall needs to hold the weight of your Door.
1. Measuring for Track Position

We highly recommend you attach your Track to a header, which is attached to your wall through the wall studs. This will provide the stability your wall needs to hold the weight of your door.

- To determine where to install your J Track, add together 4-3/8” (space above door plus the height of the J Track) plus 1/2” (floor gap) to the height of your Door. This measurement is how high up on your wall (from your floor up) you should install the Track.

\[
\text{4-3/8”} + \text{Door Height} + \text{1/2”} = \text{# of inches up from finished floor where you will pencil a horizontal line for your Track. This line will mark the center of the Track and your penciled line will be visible through the Track holes.}
\]

- This is where you will mark a horizontal line on your wall parallel to the floor, slightly longer than the length of your Track. Use a level to ensure the horizontal line is completely level.

- Take into consideration while hanging doors onto your Track, the bottom of the door must not be more than 1” off the ground or the door will ride too high and miss the Door Guide. We recommend a 1/2” space between the bottom of your Door and your finished floor.
- Check to see if your floor is level. If your floor rises more than 1/2” along the length of the Track, you risk your Door rubbing or sticking at this high point.
- If your floor is not level, measure up from the highest point of your floor to find your Track hole center position to attach the Track to your wall.

- Align the top edge of your J Track with the line you penciled for Track location. The openings for attaching our J Track are oblong to allow you to shift the Track horizontally so you can drill into your wall studs. Mark where you want to pre-drill pilot holes with a 1/8” bit.

If you are not able to drill through wall studs, we strongly recommend you attach your J Track to a Header, which is attached to your wall through the studs.
Track Installation

INSTALLATION INSTRUCTIONS

NOTE: If you are installing a Floor Mount Door Guide, your door will have a mortise (a groove that runs along the bottom of your door). Make sure this mortise is facing down towards your floor and that you install the Door Hangers on the other end.

1. Drilling Pilot Holes
   - Predrill pilot holes using a 3/8” bit.

2. Track Installation
   - Attach your J Track using Lag Screws and a ratchet, making sure you are drilling into the wall studs.

When installing your Track, be sure you are drilling into wall studs or into a Header that is installed through the wall studs. This will provide the stability your wall needs to hold the weight of your Door.

3. Soft Stop Installation
   - Attach your Soft Stop inserting its post through the hole on front of the J Track, threading the open nut on the back.
